

## Pivot

Hinge system for swing doors with opening up to 180°

## Pivot

Today, the door has become a fundamental element of interior design. The door (hinged or sliding) integrates with the atmosphere of the house, dividing the space, but furnishing itself.

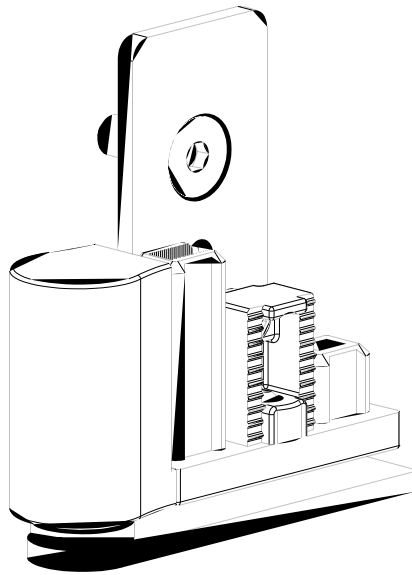

It is no longer a separate element of the home, something secondary or of little importance, but rather, it takes on a primary meaning and contributes to the aesthetic sense of the entire room. Terno Scorrevoli, which has always been focused on the functional and aesthetic problems of the market, today proposes a new type of door that further integrates the already very wide range of external sliding doors in its catalogue.

The Pivot system includes: a pair of hinges with an off-centre axis, handle shells and Zamak fittings.

The Pivot system can be installed either on the aluminium frame of the Universal series (with 6 to 8 mm thick glass panes), or on wooden doors, thus integrating with the telescopic jamb with a patented coupling system.

Pivot components are also installed on our wall system GRiD System, using the posts that this modular system provides. The system's profiles and extrusions offer the practical possibility of adapting the size of the entire frame to the available space: simply trim the extrusions to size with a 90° cut.
